

## ABSTRACT

It is an object of the invention to provide a light  
5 emitting device which can display a superior image in  
which luminescent color from each light emitting layer is  
beautifully displayed and power consumption is lowered in  
a light emitting element in which light emitting layers  
are stacked. One feature of the invention is that, in a  
10 light emitting element which comprises light emitting  
layers stacked between electrodes, each distance between  
each light emitting layer and an electrode is odd  
multiples of quarter wavelength with a range of plus or  
minus 10% thereof by controlling a thickness of a layer  
15 provided therebetween to enhance luminous output  
efficiency. Another feature of the invention is that a  
drive voltage is lowered using a high conductive material  
for the layer compared with a conventional element.
